

# Weak Acid-Strong Base Titrations

## Qualitative Analysis

weak acid + strong base → basic salt + water

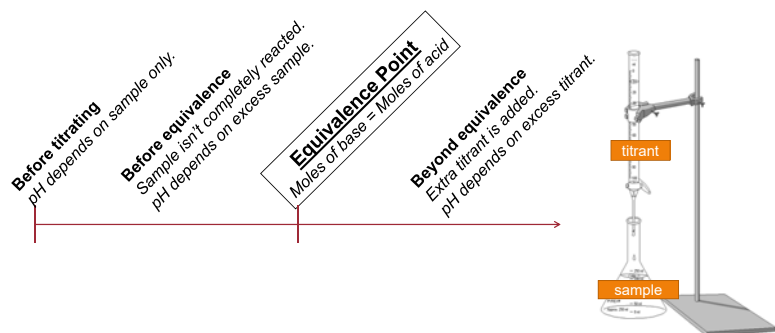

Na<sup>+</sup> does not have acidic properties  
 But C<sub>2</sub>H<sub>3</sub>O<sub>2</sub><sup>-</sup> is a **weak base**  
 ∴ solution will be slightly basic  
 at the equivalence point.

## Quantitative Analysis

Remember,  
 all titrations need to be analyzed in two steps:

- As **stoichiometry** problems:
  - How many **MOLES** of acid/base are in the solution? Which one is in excess, and how will that affect pH?
- As **equilibrium** problems
  - In the case of **weak** acids or bases, what **CONCENTRATION** of acid/base will dissociate? This determines pH.

All titrations can be analyzed at multiple points:

a) Use stoichiometry to calculate the volume of NaOH that will be required to react completely with the sample of HC<sub>2</sub>H<sub>3</sub>O<sub>2</sub>.

**Titrant:** 0.300 mol/L NaOH

**Sample:** 20.0 mL of 0.300 mol/L HNO<sub>3</sub>

- Use  $n = c \times v$  to find moles of C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>.  
 $n_{\text{acid}} = 0.300 \text{ mol/L} \times 20.00 \text{ ml}$   
 $n_{\text{acid}} = 6.00 \text{ mmol acid}$
- Use mole ratio to find the amount of NaOH required to reach the equivalence point.  
 $n_{\text{NaOH}} = 6.00 \text{ mmol HC}_2\text{H}_3\text{O}_2 \times \frac{1 \text{ mol NaOH}}{1 \text{ mol HC}_2\text{H}_3\text{O}_2}$   
 $n_{\text{NaOH}} = 6.00 \text{ mmol NaOH}$
- Use the concentration to convert the amount of NaOH to a volume.  
 $V_{\text{NaOH}} = \frac{6.00 \text{ mmol}}{0.300 \text{ mol/L}} = 20.0 \text{ mL}$

The reaction will have reached its equivalence point once 20.0 mL of base has been added.

b) Before the titrant is added, what is the pH of the solution?

1 **Stoichiometry:** How many moles of acid are present?

No base has been added, therefore no acid has reacted yet. The solution contains the original amount of  $\text{HC}_2\text{H}_3\text{O}_2$ .

2 Consider all species in the solution. Which one controls the pH?

Even though  $\text{HC}_2\text{H}_3\text{O}_2$  is a weak acid, its  $K_a$  is much higher than the  $K_w$  of water  $\therefore$  it controls the pH:

3 **Equilibrium:** What is the concentration of  $\text{H}^+$ ?

$\text{HC}_2\text{H}_3\text{O}_2$  is a weak acid  $\therefore$  it only partially dissociates. Use the  $K_a$  to find the concentration of  $\text{H}^+$  at equilibrium.

	$\text{HC}_2\text{H}_3\text{O}_2$	$\text{H}^+$	$\text{C}_2\text{H}_3\text{O}_2^-$
I	0.300	0	0
C	-x	+x	+x
E	$0.300 - x$	x	x

$$K_a = \frac{[\text{H}^+][\text{C}_2\text{H}_3\text{O}_2^-]}{[\text{HC}_2\text{H}_3\text{O}_2]} \xrightarrow{\text{sub in}} 1.8 \times 10^{-5} = \frac{(x^2)}{(0.300-x)} \quad 0.300/K_a > 100 \quad \therefore \text{use simplifying assumption}$$

$$1.8 \times 10^{-5} \cong \frac{(x^2)}{(0.300)}$$

$$x \cong 2.3 \times 10^{-3} \text{ mol/L} = [\text{H}^+] \quad x/0.300 = 0.77\% \quad \therefore \text{assumption was valid}$$

4 Calculate pH

$$\text{pH} = -\log [\text{H}^+] = -\log (2.3 \times 10^{-3})$$

$$\text{pH} = 2.64$$

Before any base is added, the  $\text{HC}_2\text{H}_3\text{O}_2$  solution has a pH of **2.64**.

c) At the equivalence point: After 20.0mL of titrant is added to the sample, what is the pH?

1 **Stoichiometry:** How many moles of acid/base are present?

At the equivalence point, exactly 6.00 mmol of NaOH has been added, which reacts with the 6.00 mmol of acid initially present.

2 Consider all species in the solution. Which one controls the pH?

All the  $\text{H}^+$  and  $\text{OH}^-$  have been consumed.

Entities in solution:  $\text{Na}^+ (\text{aq}), \text{C}_2\text{H}_3\text{O}_2^- (\text{aq}),$  and  $\text{H}_2\text{O} (\text{l})$

$\text{Na}^+$  does not affect pH

$\text{C}_2\text{H}_3\text{O}_2^-$  is a weak base and CAN affect pH. It reacts with water:

To find the  $K_b$  of this weak conjugate base, use the  $K_a$  of its acid:

$$K_w = K_a \times K_b$$

$$K_b = \frac{K_w}{K_a} = \frac{1.0 \times 10^{-14}}{1.8 \times 10^{-5}}$$

$$K_b = 5.6 \times 10^{-10}$$

Even though the  $K_b$  for  $\text{C}_2\text{H}_3\text{O}_2^-$  is small, it is still much larger than the  $K_w$  for water.

Therefore, the  $\text{C}_2\text{H}_3\text{O}_2^-$  will control the pH.

3 **Equilibrium:** What is the concentration of  $\text{OH}^-$ ?

$$[\text{C}_2\text{H}_3\text{O}_2^-] = \frac{6.00 \text{ mmol}}{20.0 \text{ mL} + 20.0 \text{ mL}} = 0.150 \text{ mol/L}$$

	$\text{C}_2\text{H}_3\text{O}_2^-$	$\text{H}_2\text{O}$	$\text{HC}_2\text{H}_3\text{O}_2$	$\text{OH}^-$
I	0.150	-	0	0
C	-x	-	+x	+x
E	$0.150 - x$	-	x	x

$$K_b = \frac{[\text{C}_2\text{H}_3\text{O}_2^-][\text{OH}^-]}{[\text{HC}_2\text{H}_3\text{O}_2]}$$

$$5.6 \times 10^{-10} = \frac{(x^2)}{(0.150-x)} \cong \frac{(x^2)}{(0.150)} \quad 0.150/K_b > 100 \quad \therefore \text{use simplifying assumption}$$

$$x \cong 9.2 \times 10^{-6} \text{ mol/L} = [\text{OH}^-] \quad x/0.150 = 0.0061\% \quad \therefore \text{assumption was valid}$$

4 Calculate pOH and pH

$$\begin{aligned}\text{pOH} &= -\log [\text{OH}^-] \\ &= -\log (9.2 \times 10^{-6}) \\ \text{pOH} &= 5.04\end{aligned}$$

$$\begin{aligned}\text{pH} &= 14.00 - \text{pOH} \\ &= 14.00 - 5.04 \\ \text{pH} &= 8.96\end{aligned}$$

In general, at the equivalence point of a titration between a weak acid and a strong base, the pH will be **slightly basic**.

A typical pH curve for a weak acid-strong base titration
